Research Interest

Burrowing crabs make up a significant proportion of the benthos in the coastal sediments of New Zealand. These organisms are active deposit feeders and occur in large densities across a wide range of habitats. Burrowing organisms perform a major ecosystem function in soft sediment habitats. Bioturbation increases sediment/detrital mixing as well as increasing sediment permeability and chemical exchange at the water/sediment interface. Burrowing influences nutrient flux and regeneration by increasing the surface area available for these processes to take place. Because of these factors, the impact of burrowing crabs on the benthos is thought to be substantial.

Although burrowing crabs are numerous in many locations around New Zealand's coast, little work has been undertaken to determine their impact on nutrient cycling. Benthic systems are responsible for up to half of the nutrients made available for primary production in coastal regions with benthic organisms playing a key role in the regulation of nutrients in to and out of the water column.

The overall focus of this study is to examine the effects of burrowing crabs on major ecosystem processes such as nutrient exchange. This study will focus on both local and system scale affects in two differing sedimentary habitats.

Key Research Questions

- Is crab behaviour and activity likely to affect benthic nutrient processes?
- Does crab and burrow density alter nutrient recycling?
- Do crabs alter the sediment structure and stability by creating burrows and does this change with sediment type?
- Can local scale experiments and measurements be up scaled to ecosystem level processes?

About me

Having completed my degree in Marine Biology in Portsmouth (UK) I moved to the South West of England where I worked in the benthic ecology group at Plymouth Marine Laboratory for several years. I moved to Hamilton in October 2006 to start my PhD at Waikato. In my spare time I enjoy reading, cooking, socialising, snorkelling/swimming and exploring New Zealand's magnificent scenery.
